

ISO/IEC 27001 Auditor

INFORMATION SECURITY TRAINING

COURSE OVERVIEW

The ISO 27001 Auditor course covers the international standard published by the International Standardization Organization (ISO), that describes how to manage information security in a company. ISO 27001 can be implemented in any kind of organization, profit or non-profit, private, small or large government owned. It was written by the world's best experts in the field of information security and provides methodologies for the implementation of information security management in an organization. It also enables companies to become certified, which means that an independent certification body has confirmed that an organization has implemented information security compliant with ISO 27001.

A successful ISO/IEC 27001 Auditor candidate should be able to perform audits against ISO 27001, lead organizations through an audit program and direct audit teams. Their individual information security expertise, complexity of the information security management system and the support given for the use of ISO 27001 in their work environment will all be factoring that impact what the ISO27001 Auditor can achieve.

TARGET AUDIENCE

This qualification is aimed at two audiences. The first is third-party auditors who work for Certification Bodies and will conduct audits to certify organizations against ISO 27001 and ISO 19011. The second audience is internal auditors who wish to understand the specific requirements of auditing Information Security Management Systems (both internal and external) for conformity with the ISO 27001 and ISO 19011 standard. Internal auditors working in an organization which is implementing or already has ISO 27001 certification will find this course useful to improve not only their understanding of the subject but also the application of ISO 27001 within their organization.

LEARNING OBJECTIVES

The key things you will learn in this course:

- How to audit organizations to identify conformity with ISO 27001.
- How to evaluate the principles of risk management - including risk identification, analysis and evaluation.
- How to propose appropriate treatments and controls to reduce information security risk, support business objectives and improve information security.
- Leading organizations through an audit program.
- Directing audit teams.
- Evaluating the effectiveness of applied corrective actions to maintain ISMS conformity with ISO 27001.
